

A. Measles: recent incidence was much higher than the annual average

Four weeks ending September 5: 178 cases/week; previous four weeks: 85/week

B. Temperature: forward-looking models differed from extrapolating the year so far

All seven NASA September predictions for 2026; points and published 95% uncertainty bars

Dashed line: approximate equivalent of 1.285°C on the contract baseline (using NASA FAQ offset of +0.19°C).

Baseline conversion and interval interpretation require reconciliation before estimating a contract probability.

Sources: CDC weekly cases; NASA GISTEMP GMSTA September 2026 CSV. Post-reveal diagnosis; original scores unchanged.
